Table SA: Glossary and abbreviations

Term	Meaning
ALS	Advanced life support: resuscitation techniques and protocols used by trained medical professionals to provide urgent treatment to patients in cardiac emergencies.
Aortic occlusion balloon	A technique used in NRP to ensure that perfusion of the organs is limited to those to be transplanted excludes of the brain. An intraluminal occlusive balloon is introduced into the aorta via peripheral cannulation and inflated after declaration of death and before the commencement of NRP.
Autoresuscitation	The return of spontaneous circulation after CPR has been attempted, deemed futile and terminated. It is also known as the Lazarus effect.
Best interests	When a person lacks capacity, decisions must be made in their best interests as per the MCA 2005 and the GMC’s Good Medical Practice guidance.
cDCD	Controlled donation after circulatory determination of death: recovery of organ(s) after death has been declared by cardio-respiratory criteria criteria following the planned withdrawal of life support, usually in the intensive care unit setting (also referred to as Maastricht category 3).
Cold preservation solution	A technique used to preserve organs for transplantation; a cold preservation solution is infused into the organ and then stored at a hypothermic temperature.
CPR	Cardio-pulmonary resuscitation.
DBD	Donation after brainstem death: recovery of organ(s) for the purposes of transplantation after death has been declared by neurological criteria.
DCD	Donation after circulatory determination of death: recovery of organ(s) for the purposes of transplantation after death has been declared by cardio-respiratory criteria.
Declaration of death	Legal declaration of death performed by a doctor on the basis of either circulatory or neurological criteria.
ECMO	Extracorporeal membrane oxygenation: a technique used to provide cardiac and respiratory support to patients by removing deoxygenated blood from the venous system, externally removing carbon dioxide, oxygenating, and returning it to the arterial system.
E-CPR	Extracorporeal cardio-pulmonary resuscitation: use of ECMO in the context of cardiac arrest.

Expanded criteria donor	Donors of organs for the purposes of transplantation who are over the age of 60, or over the age of 50 with two of the following: hypertension, creatinine le, or death resulting from a stroke.
GMC	General Medical Council: independent regulatory body with duties set out by the Medical Act 1983.
Hands-off time	Also referred to as ‘no-touch time’, the time interval between termination of resuscitation and declaration of death. A minimum period is usually mandated in the organ donation context in order to exclude the possibility of autoresuscitation.
MCA	Mental Capacity Act 2005: legislation on capacity assessments and best interests decision making.
NRP	Normothermic regional perfusion: in-situ preservation of organs with oxygenated blood at normothermia using extracorporeal membrane oxygenation devices. Sub-types include abdominal NRP (A-NRP) and thoracoabdominal NRP (TA-NRP).
Organ-Preserving cardio pulmonary resuscitation	OP-CPR: CPR performed after the point at which further CPR is deemed to be futile. The purpose of OP-CPR is to maintain blood flow to the organs and thus preserve them for the purposes of transplantation.
OPT	Organ preserving techniques: practices implemented between declaration of death and organ recovery, aimed at preserving the quality of organs and minimizing ischemic injury. Examples of OPT are cold preservation solution and NRP.
PEA	Pulseless electrical activity: a non-shockable cardiac rhythm.
Return of spontaneous circulation	Return of spontaneous circulation: the resumption of cardiac and respiratory effort in a patient that has sustained cardiac arrest.
TOR	Termination of resuscitation: the decision to stop resuscitative efforts for reasons of futility.
uDCD	Uncontrolled donation after circulatory determination of death: recovery of organ(s) for the purposes of transplantation after death has been declared by cardio-respiratory criteria on arrival at the emergency department (also referred to as Maastricht category 1) or after unsuccessful resuscitation attempts (also referred to as Maastricht category 2).
VF	Ventricular fibrillation: a shockable cardiac rhythm.

Table SB: Summary of changing definitions of death

Pre-1960s:	Death was diagnosed according to ‘cardiac and respiratory’ criteria(48) and organs typically came from non-heart-beating donors(54).
1968-1991:	Organ donation expanded to include DBD, which required the development of ‘brain’ death as an alternative criterion(54), enshrined in the Uniform Determination of Death Act (USA)(48). Most organs were procured from DBD.
1990s:	There were new efforts to procure more organs, and cDCD was re-explored. Death was in these cases defined according to ‘cardiac’ criteria(48).
2006	There was a shift from cardiac to ‘circulatory’ determination of death, as per the Institute of Medicine in their 2006 report(48). The terms ‘permanence’ (circulation <i>will not</i> be restored) and ‘irreversibility’ (circulation <i>cannot</i> be restored) were introduced and the ‘dead donor rule’ (that the recovery of organs cannot precede or promote the onset of death(55) was considered respected because cDCD protocols preclude further resuscitation and the absence of cardiac activity is therefore permanent and will soon be irreversible(48).
Current	In the UK there is no statutory definition of death. Instead, the definition is based on common law acceptance of professional guidance. Professional guidance provides that death can be declared following either the (i) irreversible cessation of brainstem function or (ii) the irreversible cessation of cardiorespiratory function(83).
